

AI FitFabrica

Инвесторская презентация: экономика, себестоимость, маржа и масштабирование

50 KZT 1 credit baseline внутренняя валюта продукта	3x balanced markup рабочая стартовая наценка	20-50 real runs нужны для recalibration
--	---	--

- AI FitFabrica продаёт не токены и не картинки, а управляемые fashion-commerce workflows.
- Backend контролирует агенты, качество, retry/repair, storage, credits ledger и итоговый результат.
- Документ показывает baseline v1/v2 экономику для обсуждения с инвесторами; это не audited financial statements.

Дата: 17 июня 2026. Provider pricing source: Google Gemini API pricing. Live billing не менялся.

1. Investment summary

- Платформа решает B2C и B2B задачи: virtual try-on, product cards, model photo/content generation, similar search, outfit recommendation и pricing analytics.
- Ключевой источник выручки: paid workflows в credits, B2B packages и add-ons.
- Ключевой источник маржи: reuse structured analysis, early input rejection до generation, пакетирование generated images и контроль repair/retry.
- Ключевой риск: стоимость визуальной генерации и repair rate. Он управляется quality gates и cost metadata на каждом agent call.

B2C Try-On entry массовый пользовательский сценарий	B2B Product Card лучший путь к оплате продавцами	Upsell Content Packages рост среднего чека
---	--	--

2. Product value and revenue logic

Пользователь платит за готовую ценность: примерку, карточку товара, контент-пакет, поиск похожего товара или pricing report. Внутренние model calls скрыты от пользователя и оптимизируются backend-ом.

Revenue model:

- Credits packages for B2C/B2B actions.
- Higher-priced B2B packages with 1/3/5 generated images.
- Paid add-ons: stylist advice, extra variant, regeneration by user request, expanded marketplace search.
- Future B2B subscription or monthly package can be layered after product-market validation.

Trust model:

- Bad input is blocked before expensive generation.
- System/provider failures do not charge user credits.
- Quality Verifier blocks broken generated results before user delivery.

3. Baseline unit economics

Action	Avg direct cost	Internal cost	Balanced credits	User price	Expected margin
Try-On Basic	\$0.09	45 KZT	3	150 KZT	70.00%
Try-On + Stylist Advice	\$0.10	50 KZT	3	150 KZT	66.67%
Product Card Text Only	\$0.04	20 KZT	2	100 KZT	80.00%
Product Card + Photo + QV	\$0.09	45 KZT	3	150 KZT	70.00%
Similar / Cheaper Search	\$0.03	15 KZT	1	50 KZT	70.00%
Outfit Recommendation	\$0.05	25 KZT	2	100 KZT	75.00%
Content Package + 5 images	\$0.34	170 KZT	11	550 KZT	69.09%

Baseline assumptions: 1 credit = 50 KZT, 1 USD = 500 KZT, internal cost includes 20% operational reserve. Prices must be recalibrated after real runs.

4. Cost stack by workflow

Workflow	Cheap components	Expensive components	Margin lever
Try-On	Human/Garment/Material analysis, instruction	image generation, repair image edit	block bad photos early; reduce repair rate
Product Card	garment analysis, text generation	model photo generation + quality verifier	reuse saved analysis; upsell photo/QV
Similar Search	query builder, pricing explanation	external connector/API/proxy cost	track no-result search cost
Outfit	stylist text reasoning, profile read	marketplace add-ons if enabled	sell real-product add-ons separately
Content Package	channel copy, export	1/3/5 generated images + QV	package pricing and B2B average check

5. Try-On economics and repair exposure

Step	Provider cost	Internal cost	User charge	Reason
Human Identity	\$0.0055	\$0.0066	free if blocked	prevents unsuitable input spend
Garment + Material	\$0.0123	\$0.0147	free if failed	structured facts before generation
Instruction	\$0.0048	\$0.0058	free if failed	no image generation yet
Image generation	\$0.0400	\$0.0480	charged on success	main cost center
Quality Verifier	\$0.0066	\$0.0079	included	protects output quality
Repair instruction	\$0.0054	\$0.0065	free if our issue	Gemini analysis only
Repair image generation	\$0.0400	\$0.0480	free if our issue	separate image edit cost
Second verifier	\$0.0060	\$0.0072	free if our issue	post-repair gate

Investor takeaway: Try-On margin depends on first-pass success rate. Each free repair adds both image edit cost and second verification cost.

6. B2B packages

Package	Avg cost	Balanced credits	User price	Margin	Positioning
Product Card Text Only	\$0.04	2	100 KZT	80.00%	entry B2B action
Product Card + 1 Model Photo	\$0.08	3	150 KZT	73.33%	visual upsell
Product Card + Photo + QV	\$0.09	3	150 KZT	70.00%	production-safe visual
Product Card + Content Package	\$0.13	4	200 KZT	67.50%	channel-ready package
Content Package + 3 Images	\$0.22	7	350 KZT	68.57%	mid-tier merchant package
Content Package + 5 Images	\$0.34	11	550 KZT	69.09%	higher ACV package

Investor takeaway: B2B packages are more attractive than single low-price actions because they increase average order value while reusing already saved garment/product analysis.

7. Marketplace and no-result economics

- Similar/Cheaper Search must keep marketplace_connector_cost configurable.
- external_api_cost_usd, parser/proxy/search cost and no-result search cost must be tracked separately.
- No hidden scraping should be used; only approved APIs, partner feeds, seller catalogs or approved public links/connectors.
- If search returns no value, the provider/internal cost is still a platform cost and should be visible in recalibration.

8. Model-cost strategy

Not every agent needs the most expensive model. The correct architecture is model routing by task risk and modality, not hardcoding one model everywhere.

Task type	Use cheaper model	Use stronger/image model
Profile / credits explanation	yes	no
Product Card text-only	yes	only on complex channel rules
Human/Garment/Material vision	standard vision tier	upgrade on ambiguity
Quality Verifier	baseline vision	stronger for final production gate
Try-On / image edit	no	Nano Banana / image generation-edit provider
Repair	instruction cheap/vision	image edit expensive and separate

9. What investors should watch

- Actual avg Try-On cost.
- Actual avg Product Card cost.
- Repair rate and retry rate.
- Failed free job cost.
- Real margin by workflow.
- Conversion from B2C Try-On to paid credits.
- Conversion from Product Card to Content Package.

Repair rate

quality KPI
directly impacts margin

B2B AOV

revenue KPI
packages drive upside

Provider cost

risk KPI
requires routing/config

10. Risks and mitigations

Risk	Impact	Mitigation
Provider price increase	margin compression	versioned price config, model routing, provider-neutral adapters
High repair rate	free platform cost	better input policy, QA gates, prompt/model tuning
No-result marketplace search	hidden loss	separate no-result cost accounting
Poor generated quality	trust loss	Quality Verifier and Repair pipeline
Billing confusion	support/refund issues	backend-owned credits ledger, clear policy
Overuse of expensive models	avoidable cost	route simple tasks to cheaper models

11. Recalibration plan

Before approving final public pricing, run 20-50 real staging/prod workflows and produce a recalibration report.

- Compare estimated vs actual provider cost.
- Measure repair/retry rate per workflow.
- Measure failed free job cost.
- Measure real revenue and margin by workflow.
- Update credits table only after reviewing real data.

Decision after recalibration:

- keep or change 1 credit = 50 KZT;
- adjust balanced credits per workflow;
- separate add-on pricing;
- decide if B2B package pricing should be higher than baseline.

12. Funding use and milestones

Milestone	Why it matters	Evidence
Agent acceptance: Garment, Material, Quality	reduces quality risk	golden dataset + live staging runs
Real Try-On generation pipeline	core B2C demo	E2E generation + QA + credits
B2B Product Card packages	monetization path	merchant workflow and package pricing
Cost recalibration	financial confidence	20-50 run report
Marketplace connectors	commerce expansion	approved source integrations

13. Investment thesis

- AI FitFabrica can become a specialized fashion-commerce workflow platform, not a commodity AI image wrapper.
- The platform has visible levers to control cost: early input rejection, model routing, reusable structured analysis and package pricing.
- B2B packages can drive higher average check than single B2C actions.
- The current engineering baseline already includes cost metadata, credits policy, workflow estimator and investor-facing economics.
- Next proof point: real run data confirming margin assumptions and quality gates.
